

QA Testing Report

RealBugz Web Application

Project Overview

This project was completed as a personal QA practice project to apply and demonstrate my knowledge of manual software testing. The goal was to test a web application containing intentionally introduced defects and to identify, reproduce, and document the issues found.

The testing focused on verifying that the application behaved according to its requirements and detecting unexpected or incorrect behavior.

Testing Activities

As part of the project, I created and executed test cases covering both positive and negative scenarios. The testing included:

- Functional testing
- Positive and negative testing
- Form and input validation
- UI and functionality verification
- Test case documentation
- Defect identification and reporting

Test cases were documented with their expected and actual results, and identified defects were linked back to the corresponding test cases.

Tools and Technologies

The following tools and technologies were used during the testing process:

- Microsoft Excel — test case and defect documentation
- Postman — API testing

Test Execution Summary

A total of 16 test cases were created and executed during the testing process.

11 defects were identified and documented based on the test results. Each defect was documented with information such as the steps to reproduce, expected result, actual result, severity, and priority.

Defect Reporting

The identified defects covered different types of issues, including incorrect validation, broken links, incorrect application behavior, and UI-related problems.

Each defect was documented in a structured format to make it possible for a developer to reproduce and understand the issue.

Example information included in the defect reports:

- Defect ID
- Related test case
- Description
- Preconditions
- Steps to reproduce
- Expected result
- Actual result
- Severity
- Priority

Conclusion

This project allowed me to apply the knowledge gained from my QA training in a practical testing environment. It gave me experience in designing test cases, executing tests, identifying defects, and documenting issues in a structured manner.

The project also helped me improve my understanding of the QA process and the importance of clear and reproducible defect reports.
